

TASK 3 : Model Deployment using FastAPI

Name: Sajal Sowna

Internship Platform: InternSpark (Powered by Alfido Tech)

Task: Deploy the Resume Classification model using FastAPI and Docker

1. Objective

Deploy the Resume Classification model built in Task 2 as a REST API using FastAPI and prepare it for deployment using Docker.

2. Project Overview

The trained deep learning model was integrated with FastAPI to create endpoints that accept resume text and return a predicted category with confidence score.

3. Files Used

app.py
Dockerfile
README.md
resume_classifier.keras
requirements.txt

4. Technologies Used

Python
FastAPI
TensorFlow
Uvicorn
Docker
Pandas
NumPy
Scikit-learn

5. Code Information

The app.py file loads the trained model, preprocesses resume text, and exposes GET and POST endpoints for prediction.

6. GitHub Code Link

Paste your GitHub repository link here after uploading the project.

7. How to Run

Activate virtual environment
Run: `python -m uvicorn app:app --reload`
Open: `http://127.0.0.1:8000/docs`

8. API Endpoints

GET / : Home route

POST /predict : Predict resume category

9. Results and Screenshots

Swagger UI

Explanation: Swagger UI generated while testing the API deployment.

Prediction Request and Response

Explanation: Prediction Request and Response generated while testing the API deployment.

10. Conclusion

The Resume Classification model was successfully deployed as a FastAPI application and tested through Swagger UI.

11. Future Improvements

Deploy to cloud platforms, improve model accuracy, and secure API endpoints.
